

I am not an RF engineer and don't have the qualifications to argue the specifics. It seems pretty logical that BPL will interfere with the HF spectrum between 0.5Mhz to 30Mhz given the unshielded transmission lines and the power required to pass data at high speeds. Any increase in the existing noise floor will impinge on the existing users of this spectrum, including amateur radio. As a licensed operator for over 20 years I am concerned about the negative effects this interference will have and that it may prevent me from performing my service to the community. I would request that his proposal not be approved.
